

Seeking volunteers to test a hand-gesture-based museum experience for an engineering capstone design project.

We are looking for people of all backgrounds to test the intuitiveness and accuracy of this touch-free system. Participants will be asked to participate in:

- A single 20-minute appointment at the Harn Museum of Art*
- A follow-up questionnaire

** Masks required. Social distancing will be observed. Appointments can be arranged when the Museum is closed to the public to ensure minimal interaction with other people.*

We are emphasizing designing a hand-tracking technology that works for museumgoers of all skin tones and physical abilities.

To improve accessibility and ensure this product works effectively for the widest possible group of users, volunteers of the following backgrounds** would be especially beneficial to this goal:

- People with dark skin tones
- People with chronic fatigue and/or limited mobility
- People with upper-limb differences
- Wheelchair users

*** This testing will not be published in a formal research paper. This is purely for internal use as a part of our coursework in the Integrated Product and Process Design program. Your identity will not be shared with anyone outside of the team. You will not be obligated to disclose any health details with us beyond the terms used in the list above.*

There is no compensation for participating. However, your participation will be a valuable addition to our research and findings will help to improve accessibility at the Harn Museum of Art.
